

Premium Visitor Management System

React Frontend — Figma AI / Figma Make Prompt

1. Project Direction

Act as a Senior UI/UX Designer, Product Designer, and Senior React Frontend Developer. Design and build a world-class PREMIUM VISITOR MANAGEMENT WEB APPLICATION using React.js. Replace the old desktop-style visitor-management interface with a modern, clean, professional, responsive web application. Use the uploaded existing visitor-management screenshot only as a functional reference; do not copy its old visual design.

2. Tech Stack

React.js, React Router, Tailwind CSS, Lucide React icons, component-based architecture, responsive CSS, reusable components, mock API/data layer, QR code generation, camera/photo capture, image preview, and form validation.

3. Visual Style

Premium enterprise SaaS appearance; clean, minimal, trustworthy, secure and professional. Use deep navy/professional blue as primary, modern blue with teal/cyan accent, green success, amber warning, red error, and a very light neutral background. Use Inter/Geist/Manrope-style typography, 10–16px rounded corners, subtle shadows, excellent whitespace and hierarchy.

4. Responsive Design

The application must work perfectly on mobile (320–767px), tablet (768–1023px), desktop (1024px+), and large desktop (1440px+). Do not merely shrink the desktop layout. Mobile should use a single column, touch-friendly controls, camera optimized for mobile, centered QR code and sticky bottom actions where useful. Tablet should use two columns where appropriate. Desktop should use a spacious two-column layout with a maximum content width around 1200–1400px.

5. Welcome Screen

Create a premium landing screen with company logo, Visitor Registration title, Help and Language controls. Main hero: “Welcome to [Company Name]” and “Register your visit quickly and securely.” Provide two large cards: New Visitor — register using employee email; Returning Visitor — continue using mobile number. Include a subtle security/privacy indicator.

6. New Visitor — Visitee Lookup

Ask “Who are you visiting?” with Employee Email ID. After a valid email, automatically fetch and display Employee Photo, Visitee Name, Employee ID, Department, Mobile Number and Email. Example: Sivakumar G, 7859, LMW - IT, 7397775905, sivakumar.g1@lmw.co.in. These employee details must not be manually entered. Provide “Change employee” and an employee-found success state.

7. Returning Visitor

Provide “Welcome back” flow. Visitor enters Mobile Number and clicks “Find My Details.” If found, automatically populate Visitor Name, Visitor Company, Purpose, Visitor Type, ID Proof, ID Proof Number, Email ID and Visit Type. Previous details must remain editable. If no record exists, show a clear empty state and offer “Register as New Visitor.”

8. Registration Steps

Use a clean stepper: Step 1 Visitee → Step 2 Visitor Details → Step 3 Photo → Step 4 Review → Step 5 Success.

9. Visitor Details

Create logical sections. Personal Information: Visitor Mobile Number*, Visitor Name*, Visitor Company*, Email ID. Visit Information: Purpose*, Visitor Type*, Visit Type*, Duration (Hours)*. Purpose examples: Official, Meeting, Interview, Delivery, Supplier, Service, Personal, Other. Visitor Type examples: Guest, Supplier, Contractor, Customer, Vendor, Interview Candidate, Other. Visit Type: Single or Multiple.

10. ID Proof

ID Proof dropdown: Aadhaar Card, PAN Card, Driving Licence, Passport, Voter ID, Other. Dynamically show the correct ID number field. PAN → PAN Card Number; Aadhaar → Aadhaar Number; Driving Licence → Driving Licence Number; Passport → Passport Number. Add appropriate validation and formatting.

11. Visit Date / Validity / Badge

Create modern date/time controls for Validity From*, Validity To*, Visit Date, Expected Arrival Time and Duration. Prevent invalid date/time combinations. Provide Badge ID, preferably automatically assigned, for example BADGE-0248.

12. Additional Details

Put optional fields into an expandable Additional Information section: Laptop Details, Mobile Details and Other Details.

13. Photo Capture

Create a premium photo component with Open Camera and Upload Photo. On mobile use the device camera; on desktop allow webcam/photo upload. After capture show preview with Retake, Remove and Use This Photo. Keep the camera experience mobile friendly.

14. Validation

Validate required fields with clear inline messages. Examples: required visitor name, valid 10-digit mobile number, valid PAN number and valid email. Validate on blur and submit without showing errors aggressively.

15. Review Screen

Create "Review Your Visit" with Employee Details and Visitor Details cards. Show employee photo, visitor photo, all entered fields, badge and validity. Each section should have Edit. Require confirmation checkbox: "I confirm that the information provided is correct." Then show Submit Registration.

16. Submission

When submitting, show a premium non-blocking loading state: "Registering your visit..." with an animated progress indicator.

17. Success Screen

After successful submission show a large success state: "Visit Registered Successfully." Display Visitor ID such as VST-20260915-00482, Badge ID, Visitee, and Visit Date.

18. QR Code

Automatically generate a QR Code containing the unique visitor registration information. Display “Your Visitor QR Code” and “Please show this QR code at the reception/security desk.” Provide Download QR, Print and Share actions. On mobile use native sharing where supported.

19. Visitor ID

Generate a unique non-duplicating Visitor ID such as VST-20260915-00482. Display it prominently and provide Copy Visitor ID.

20. Digital Visitor Pass

Create a premium digital visitor pass containing Company Logo, VISITOR PASS, Visitor Photo, Visitor Name, Visitor ID, Company, Visitee Name, Department, Visit Date, Valid Until, Badge ID, QR Code and REGISTERED/APPROVED status.

21. Desktop Layout

Use a top header and a two-column registration layout. Left: main form. Right: sticky summary with employee photo/details, visitor summary, visit date, photo preview and progress.

22. Mobile Layout

Use logo plus menu, vertical stepper, single-column form, employee card, visitor form, photo capture and review. Add sticky bottom Continue/Submit CTA. Never allow horizontal scrolling.

23. React Components

Create reusable components: Header, Stepper, EmployeeCard, VisitorForm, Input, Select, DatePicker, PhotoCapture, CameraModal, ReviewCard, QRCodeCard, VisitorPass, LoadingState, EmptyState, ErrorState and Toast.

24. Suggested React Structure

src/components: Header.jsx, Stepper.jsx, EmployeeCard.jsx, VisitorForm.jsx, PhotoCapture.jsx, ReviewCard.jsx, QRCodeCard.jsx, VisitorPass.jsx, LoadingState.jsx. pages: Home.jsx, NewVisitor.jsx, ReturningVisitor.jsx, Success.jsx. services: employeeService.js, visitorService.js. hooks: useVisitorForm.js, useCamera.js. utils: validation.js, visitorId.js. data: mockEmployees.js, mockVisitors.js.

25. Mock API Behaviour

GET /api/employees?email=sivakumar.g1@lmw.co.in should return employee name, employeeid, department, mobile, email and photo. GET /api/visitors?mobile=9600831833 should return previous visitor details. POST /api/visitors should submit the visit and generate visitorId, badgeId and qrCode.

26. Smart Behaviour

Implement email lookup, mobile lookup, auto-fill, dynamic ID proof fields, photo capture, image preview, editable previous data, date validation, mobile validation, email validation, duplicate prevention, unique Visitor ID generation, QR generation, loading states, success states, error states and toast notifications.

27. Security / Privacy

Include subtle security indicators such as “Your visitor information is securely processed.” Avoid exposing unnecessary employee information. Mask sensitive ID numbers where appropriate, for example XXXXX7543J, while allowing controlled viewing/editing.

28. Micro Interactions

Use subtle card fade-in, step transitions, button hover, input focus, success animation, QR appearance animation, photo preview animation and toast animation. Keep animations fast and professional.

29. Accessibility

Use proper labels, keyboard navigation, visible focus states, ARIA labels, good contrast, large touch targets, accessible error messages and screen-reader-friendly form structure.

30. Design System

Create reusable buttons (Primary, Secondary, Outline, Danger, Success), inputs (Default, Focus, Error, Disabled, Success), cards (Default, Elevated, Interactive), and badges (Success, Pending, Warning, Error). Use consistent spacing: 4, 8, 12, 16, 20, 24, 32, 40, 48.

31. Critical UI Instruction

The uploaded old screenshot is ONLY a functional reference. Do not reproduce the old toolbar, table-like layout, gray legacy UI, tiny text, desktop-only design, dense ERP appearance or old form arrangement. Transform it into a modern premium SaaS-style visitor registration experience.

32. Final UX Goal

The experience should feel like a modern airport reception, corporate lobby or premium enterprise visitor-management system. It must be fast, simple, secure, professional and trustworthy. A visitor should need no training and should ideally complete registration within 1–2 minutes.

33. Required Screens

Create high-fidelity screens for: Welcome/Landing; New Visitor – Employee Email; Employee Found; Returning Visitor – Mobile Lookup; Previous Visitor Found; Visitor Personal Details; Visit Details; ID Proof Selection; Dynamic ID Number; Photo Capture; Photo Preview; Review Details; Submission Loading; Registration Success; QR Code; Digital Visitor Pass; Error State; Employee Not Found; Visitor Not Found; Mobile Responsive Version; Tablet Responsive Version; Desktop Responsive Version.

34. Final Output

Create a complete high-fidelity responsive React frontend prototype. Use realistic sample data. Ensure buttons and interactions work in the prototype. Use reusable React components and clean responsive Tailwind CSS. Make the final design production-ready in appearance. Priorities: excellent UX, mobile responsiveness, clean premium UI, simple registration, employee email auto-fill, returning visitor mobile auto-fill, editable previous data, photo capture, QR generation, unique visitor ID, digital visitor pass, accessibility and validation.

Recommended User Flow

- New Visitor: Employee Email → Employee Found → Visitor Details → ID Proof → Photo → Review → Submit → Visitor ID + QR
- Returning Visitor: Mobile Number → Previous Details Found → Edit Details → Photo → Review → Submit → QR
- Keep employee information auto-filled and read-only from the visitor's perspective.
- Keep previous visitor information editable before a new visit is submitted.
- Do not place every field on one dense screen; use a guided multi-step experience.
